

Kubota breaks new ground

KUBOTA Australia is pleased to introduce the new U55-4 series of minimal tail swing excavators.

This all-new Dash 4 machine is designed to provide operators with enhanced performance, increased stability and unrivalled operator comfort.

The U55-4 is a completely new design from Kubota that increases the line up of minimal tail swing models and has many outstanding features geared towards efficiency and productivity.

Kubota has listened to the industry to learn what features operators want and has incorporated these into the new excavator.

New features include a new interior layout that makes the operating environment an enjoyable experience, twin auxiliary service ports and blade with float function.

Operators will find entry and exit easy due to the massive 450mm door clearance width and the spacious cabin layout provides operators with ample room to make the working office a pleasurable place to be.

In addition to the comfortable high-back suspension seat, operators can adjust the wrist rests to obtain a comfortable working position.

Full pilot and ergonomically placed hand controls optimise operator well-being and reduce fatigue due to the decreased force required to activate the hand controls – making one happy and productive operator.

With an all-new digital display panel conveniently located for clearly viewing vital machine information, it will even notify the operator when and what items need to be serviced.

The twin auxiliary hydraulic system provides 75 litres a minute for main auxiliary work and 37 litres a minute for secondary auxiliary work.

It is also equipped with five variable-flow preset options for both auxiliary ports to allow for a variety of attach-

ments to be used with the simple movement of the thumb-controlled auxiliary flow switches.

With the twin auxiliary service ports as standard the need for the operator to be constantly swapping over hydraulic hoses between different attachments is eliminated.

The U55-4 utilises X-frame construction for high strength and excellent stability. The frames angle design has enlarged cleanout ports for easier cleaning that saves valuable charge out time.

With the increase to five lower double flanged track rollers vibration is reduced for a smoother ride and longer track life.

Kubota has matched the new three-pump load sensing system with auto-downshift travel motors to create the ability to make quick turns on the go without the need to return the machine to the low speed setting, giving the operator a smooth flawless transition between high and low speeds.
